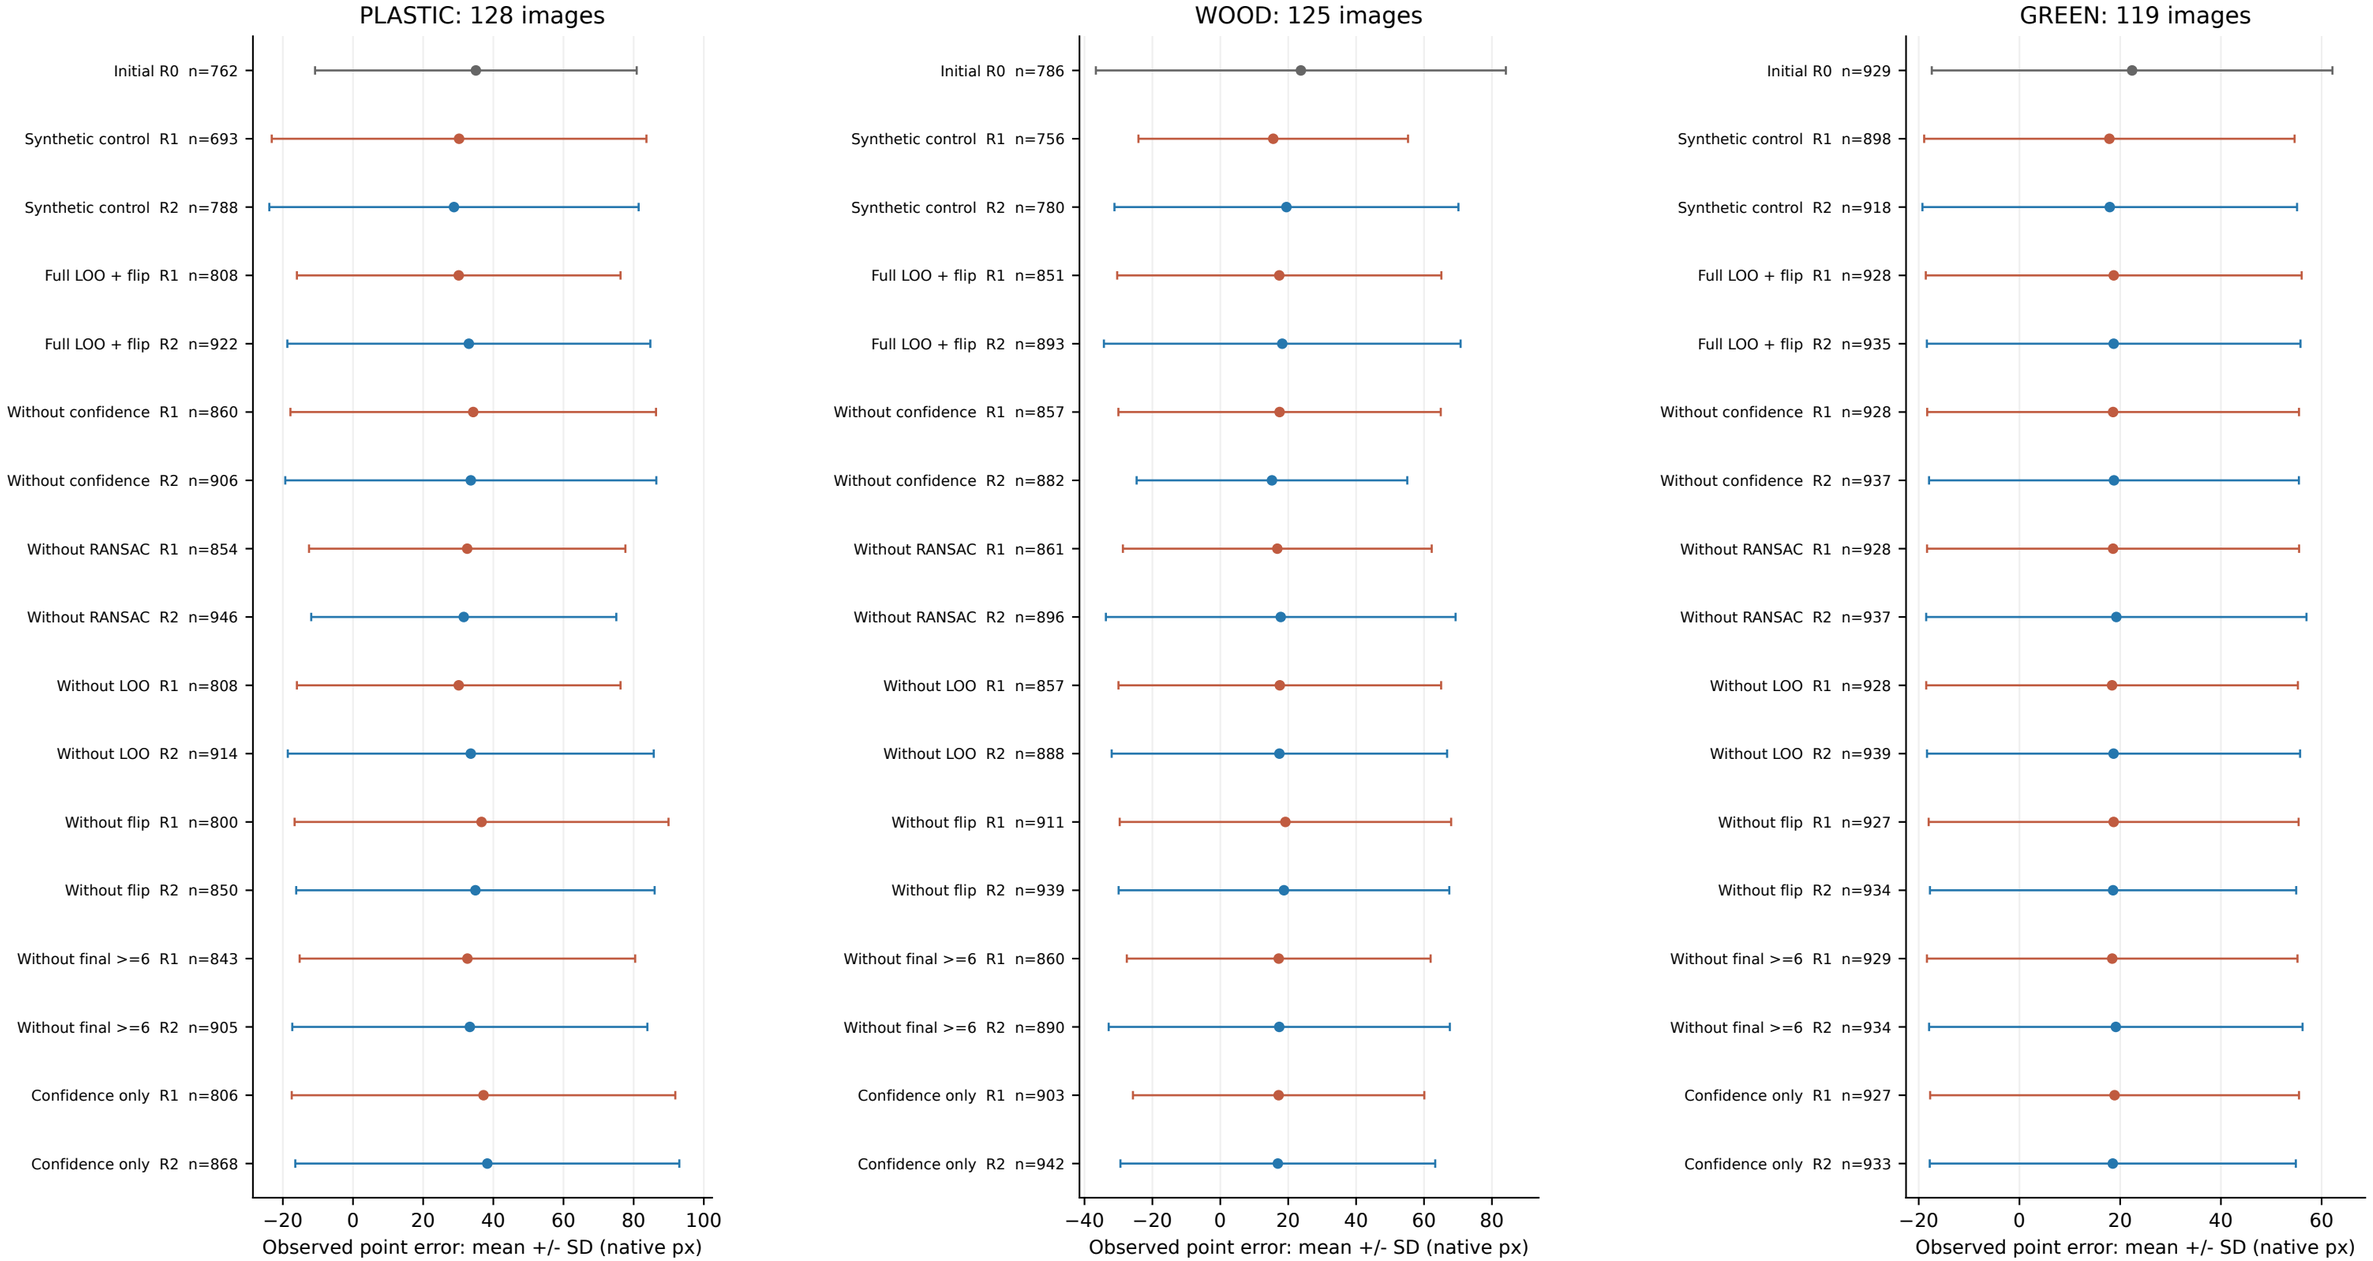
Conditional observed-point errors: all 51 evaluation groups, primary 372 images (WOOD 125)



Primary evaluation: PLASTIC 128 / 985 reference points; WOOD 125 / 963; GREEN 119 / 943. Total: 372 images / 2,891 reference points.

Mean +/- population SD (ddof=0) of observed reference-point errors; n is the number of observed points, conditional on detection.

These bars describe point-error dispersion, not bootstrap uncertainty or training-seed SD. Negative mean-SD endpoints are descriptive.

All models retained, with missing models or zero observations shown as N/A. Horizontal scales may differ by kind.

Errors use Euclidean distance in native pixels. WOOD combines 1280 x 720 and 640 x 480 images; a fixed pixel threshold has different relative tolerance.
