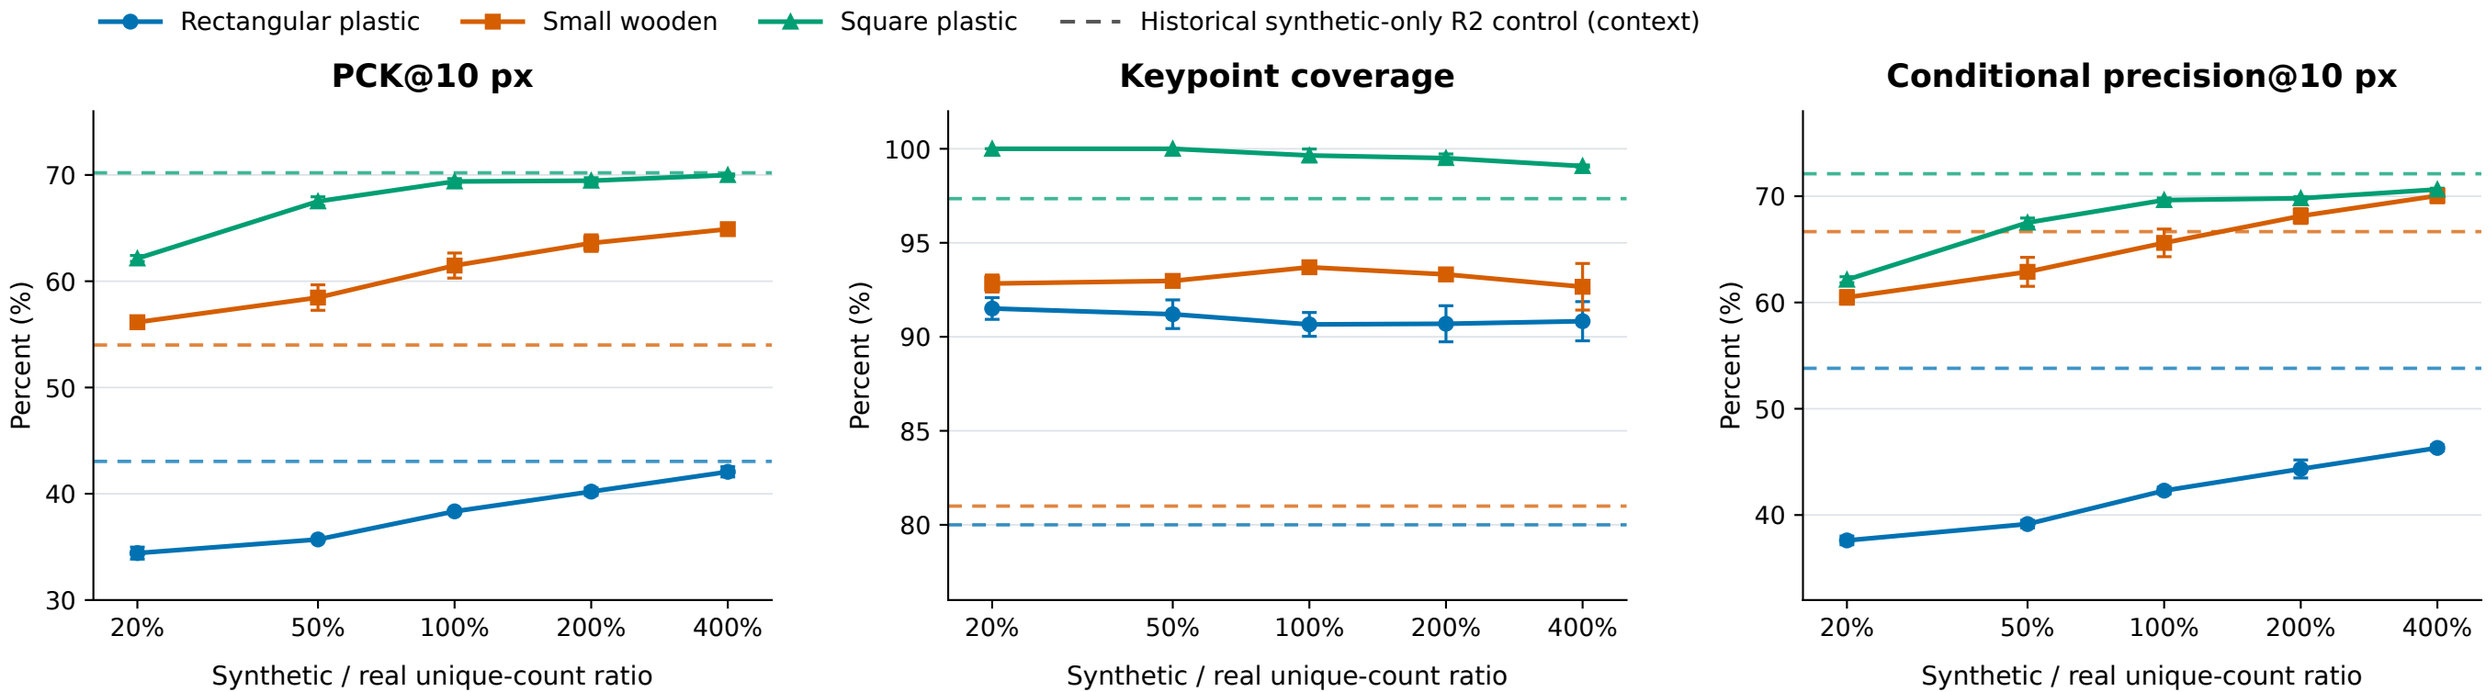
Count-proportional R2 sampling: all five conditions

Same frozen R1 teacher and pseudo-labels; 828 R2 updates per run; batch size 16



Points and error bars: mean +/- sample SD (ddof=1), R2 seeds 42/43/44 conditional on the same R1 and fixed pseudo-label sets.

Primary evaluation: 372 frames (plastic 128, wood 125, green 119). Native-pixel PCK; missing predictions are failures.

Dashed controls are historical context: the synthetic-only control has a different R1 training history; no control seed SD is estimated.

Wood combines 1280x720 and 640x480 frames and shares capture recordings with training. Paired-frame 95% CIs are in separate tables.
